WHAT IS COMPOSTING?

Composting is nature's oldest way of recycling herself. It is the natural process of decomposition and recycling of organic material, such as leaves and food scraps, and they are converted into a rich soil amendment.

Through composting, you can experience the benefits of a rich soil additive giving you healthier and greener lawns and gardens, as well as a cleaner environment.

WHY COMPOST?

Composting reduces landfill waste and incineration and therefore emissions

Composting embraces the natural circle of life

Waste less water since compost helps with moisture retention

Composting eliminates the need for chemical fertilizers
